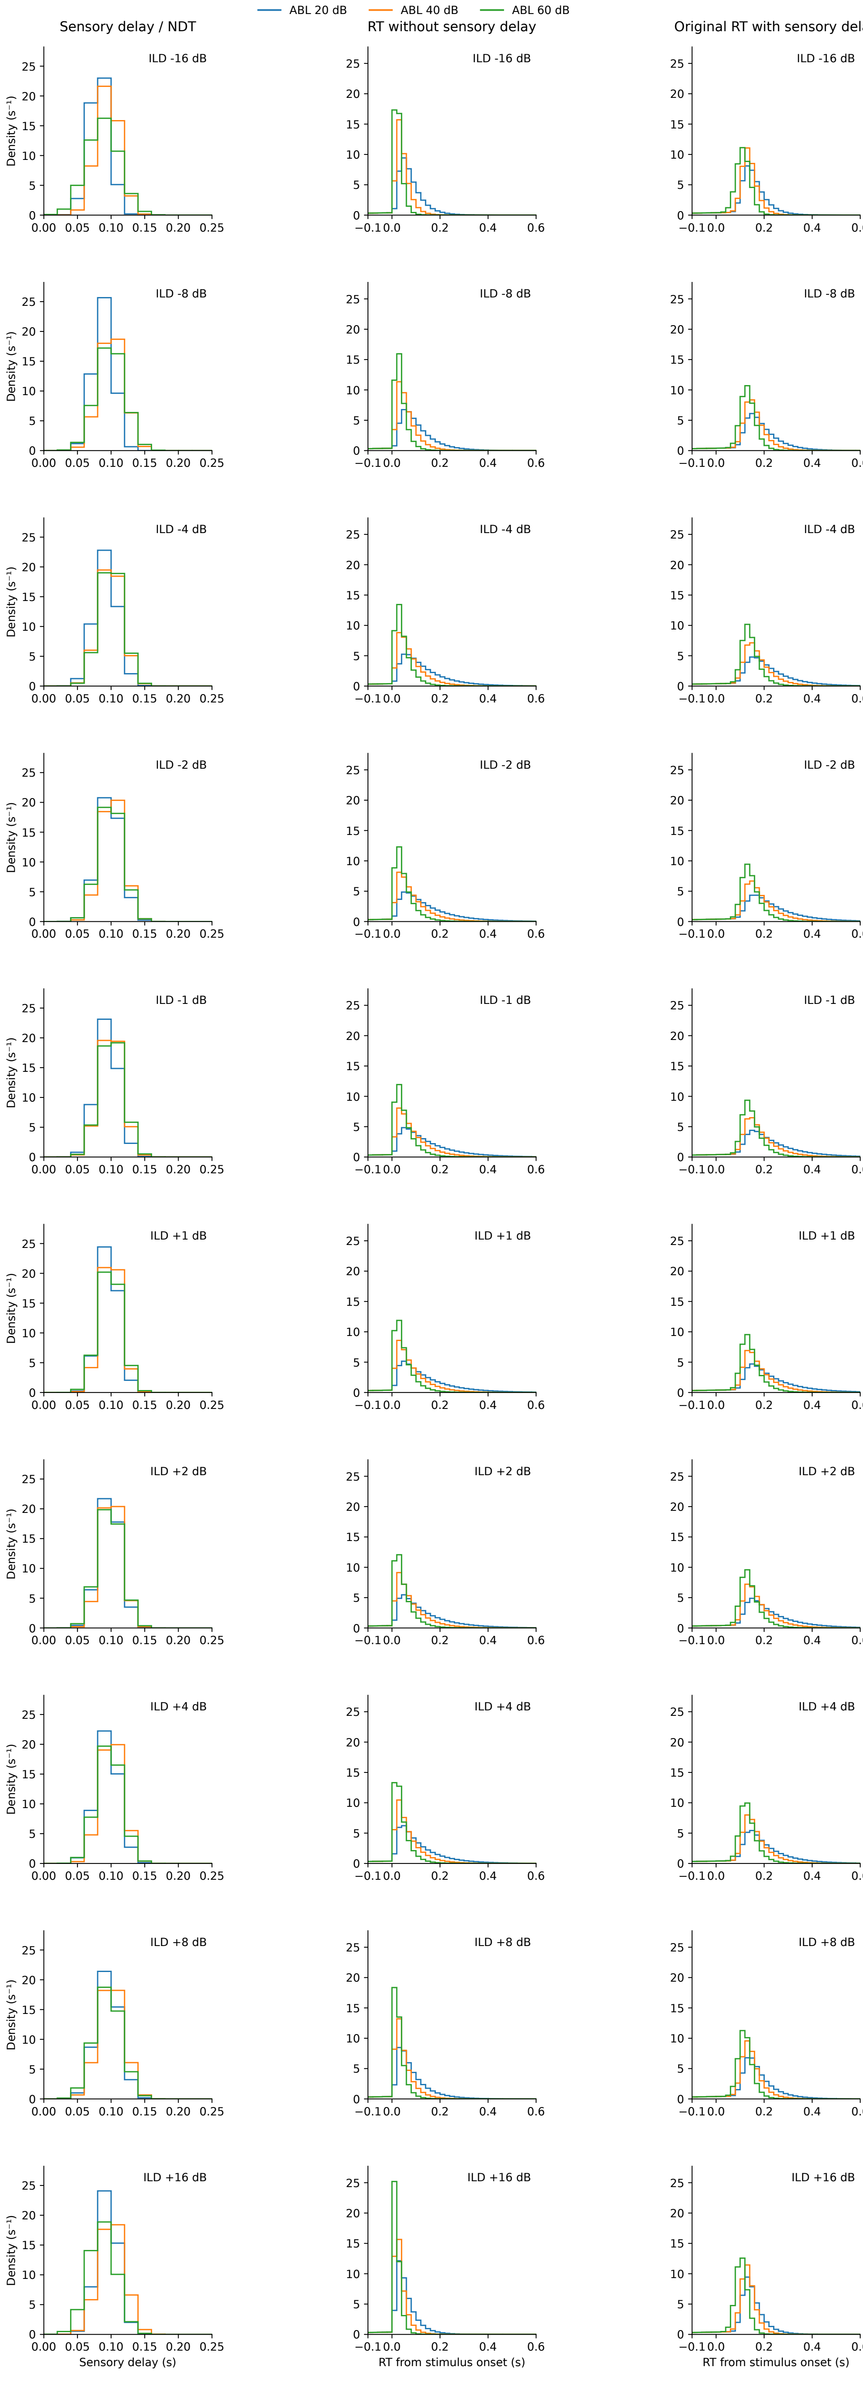
SHANK3 cohort 1 WT | NPL+alpha | sensory-delay effect
5 animals; 30 signed ABL–ILD conditions; posterior means; no refitting



Model histograms, 20 ms bins. Proactive timing, exponential lapses and all NPL+alpha parameters stay fixed.
Middle: sensory delay is exactly zero; right: saved Gaussian-delay RT prediction. No ±ILD pooling.
Both RT columns average every exact parent-trial onset, then normalize separately over [−1,1] s; display only −0.1–0.6 s.
NDT is normalized over [0,∞), without RT-window conditioning; its display is 0–0.25 s.
