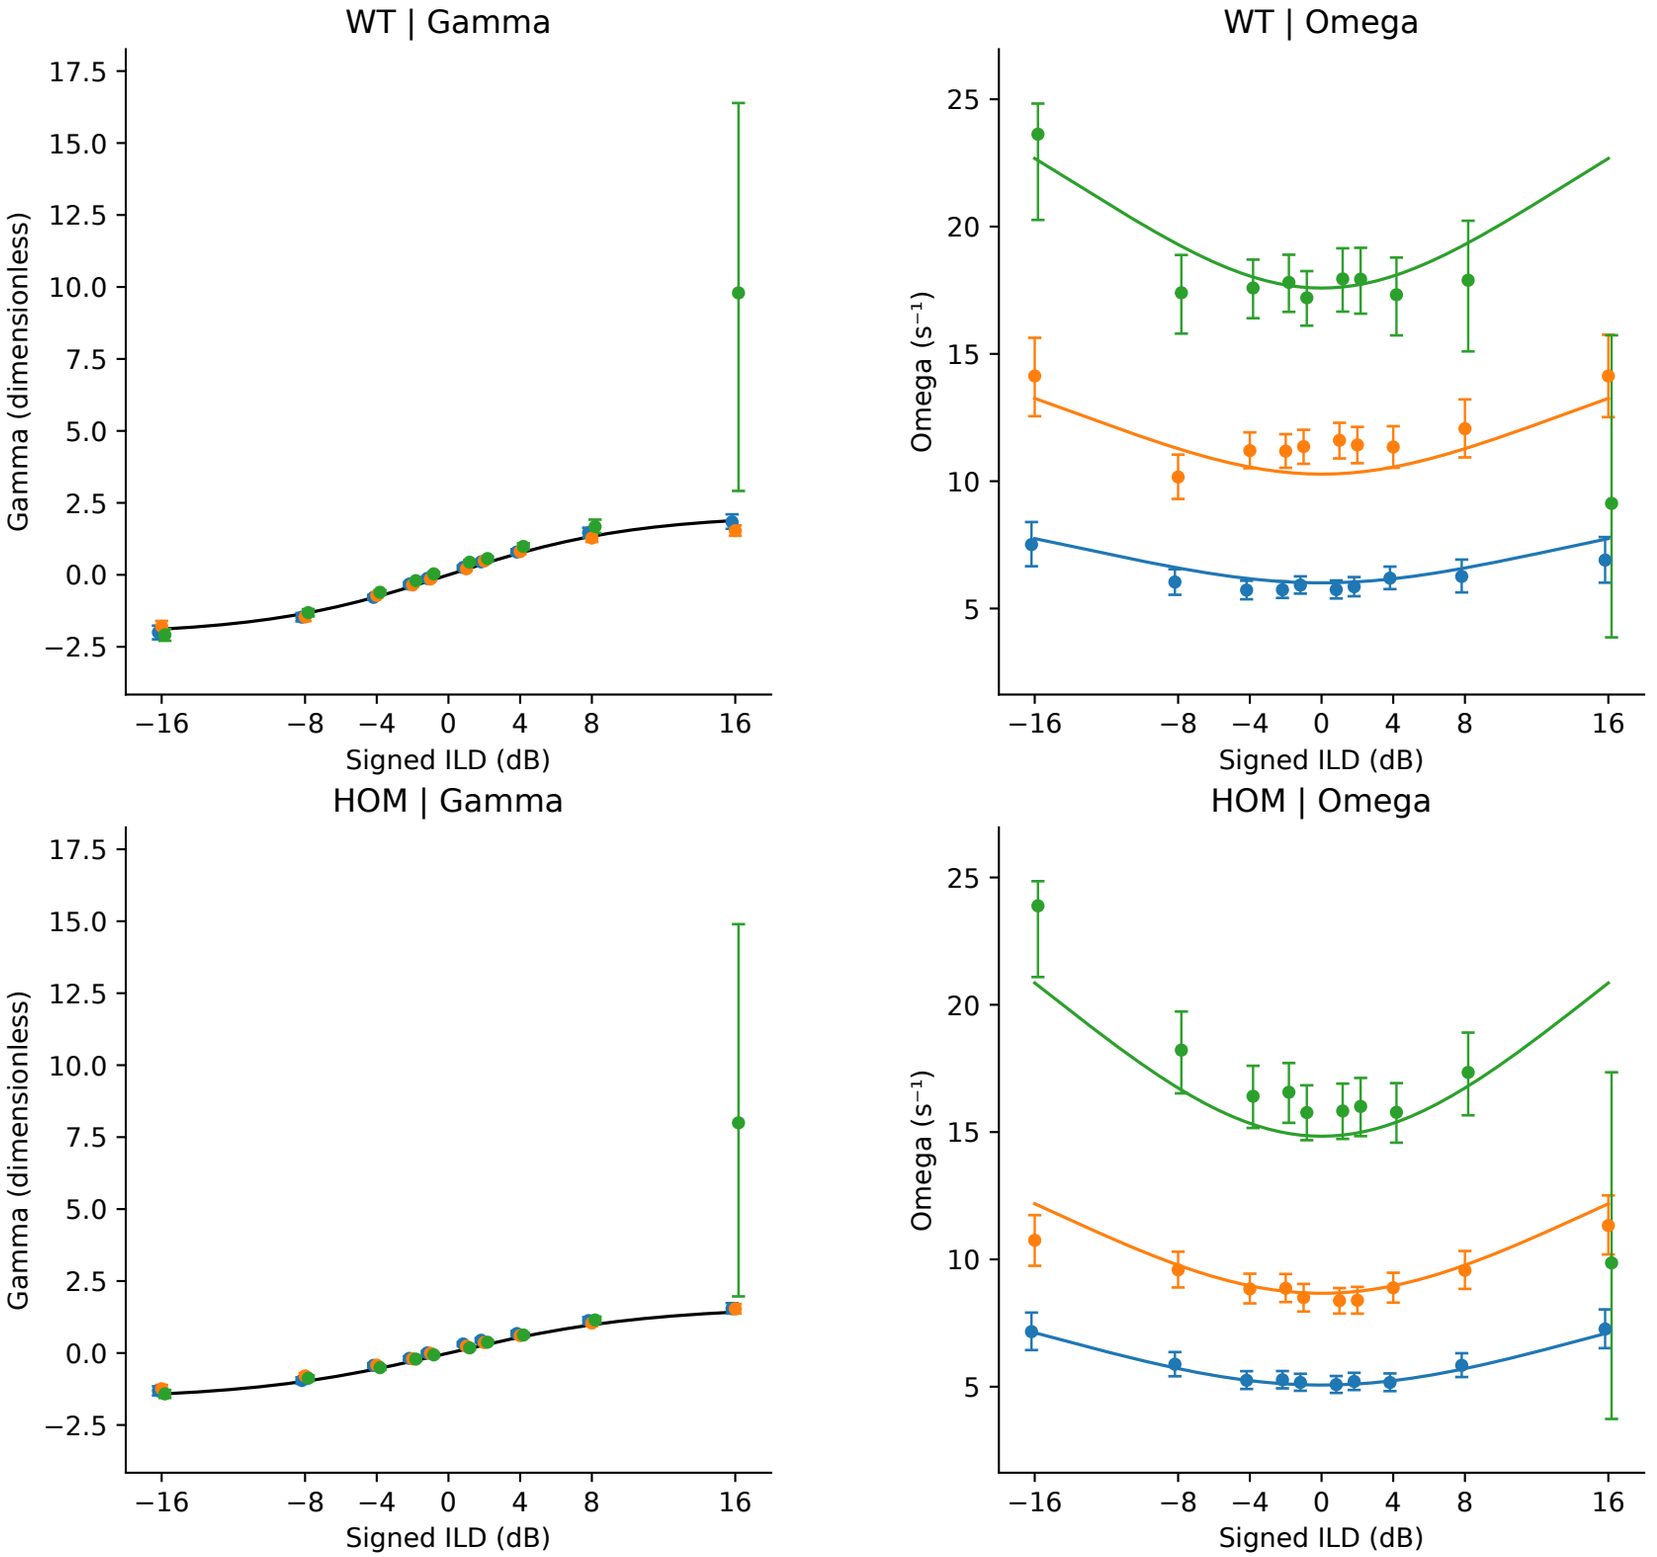
SHANK3 cohort 1 | Direct Gamma/Omega (Ω ≤ 25) versus NPL+alpha

ABL 20 dB ABL 40 dB ABL 60 dB

Dots + 95% credible intervals: condition-specific fit | Lines: continuous NPL+alpha mapping
Both fits use Gaussian sensory delays shared across ILDs within each ABL.



NPL+alpha curves evaluate the exact mapping at posterior-mean parameters, every 0.1 dB.
Its Gamma is ABL-invariant (one black curve); Omega curves use ABL colors. No curve uncertainty bands.
Dots have ±0.18 dB display offsets only. Proactive/exponential lapses fixed; NPL+alpha fit unchanged.
