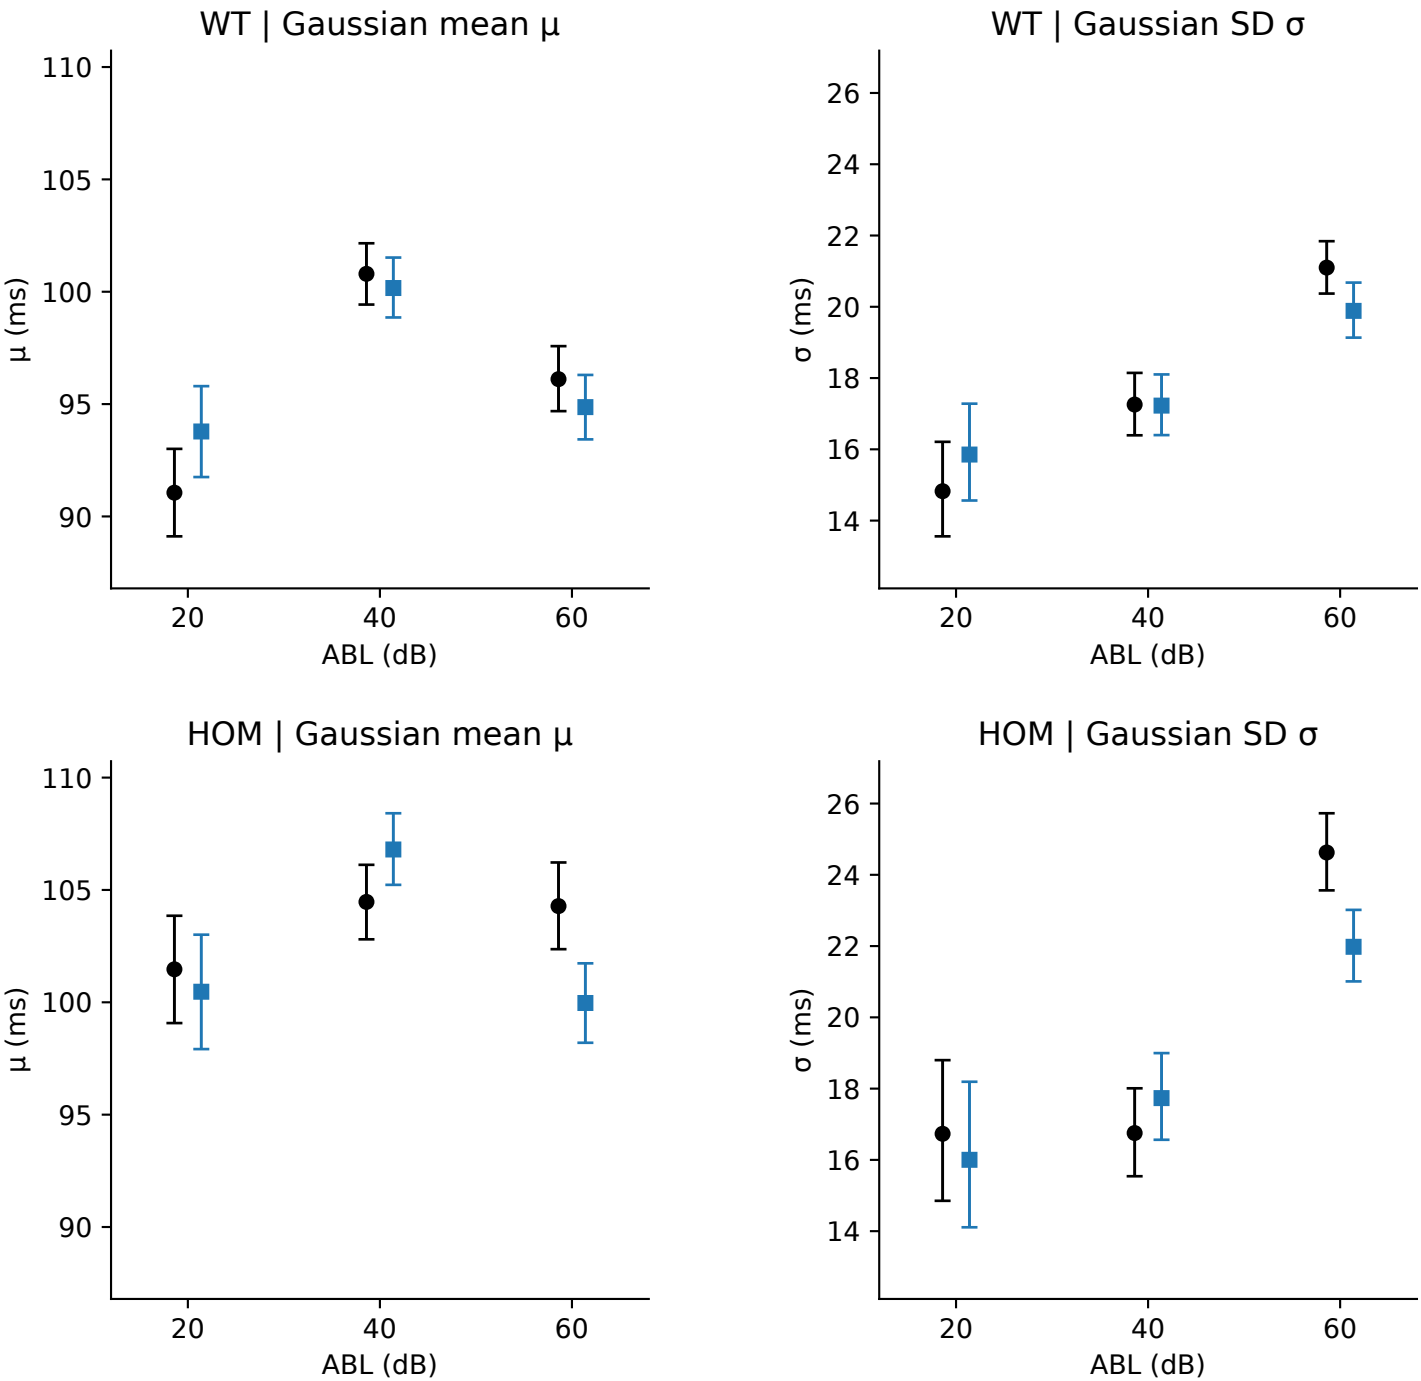
SHANK3 cohort 1 | Gaussian sensory-delay comparison | Ω upper 25 s^{-1}

Condition-specific Γ/Ω (Ω ≤ 25) ■ NPL+alpha (13 parameters)

WT: 5 animals, 68,184 choices | HOM: 6 animals, 67,715 choices



Posterior means and central 95% credible intervals from 10,000 draws per fit.
μ/σ describe the underlying Gaussian before zero truncation; delays are shared across ILDs within ABL.
Proactive/exponential lapses fixed; conditional variational uncertainty, not animal SEM.
