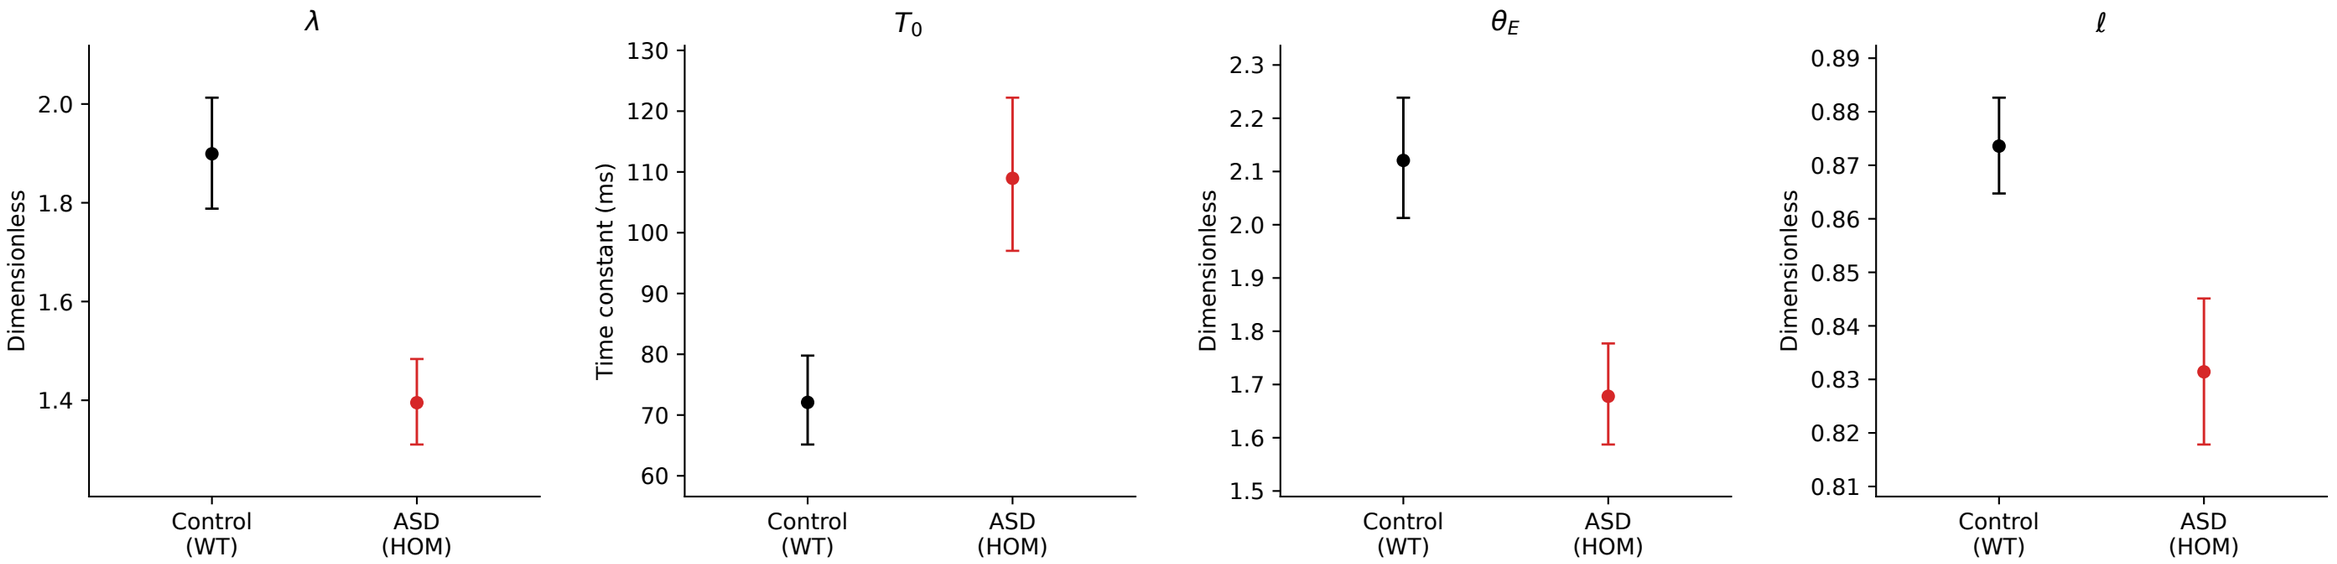
SHANK3 cohort 1 | NPL+alpha with Gaussian condition delays

Control (WT) ASD (HOM)

Posterior means and central 95% credible intervals | 67 fitted parameters per genotype



μ/σ describe the underlying Gaussian; trial delays are truncated below zero with no upper cutoff. Time units: ms.

Conditional variational uncertainty with proactive/exponential lapses fixed; bars are not animal SEMs.

10,000 posterior draws per genotype; one fresh random seed-0 start. All 13 plotting areas are equal squares.
