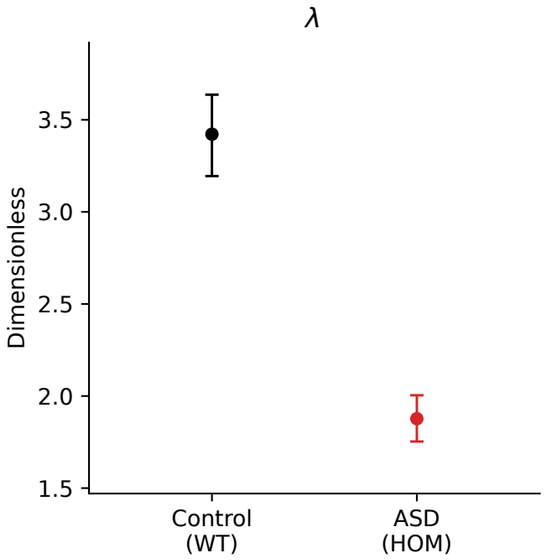
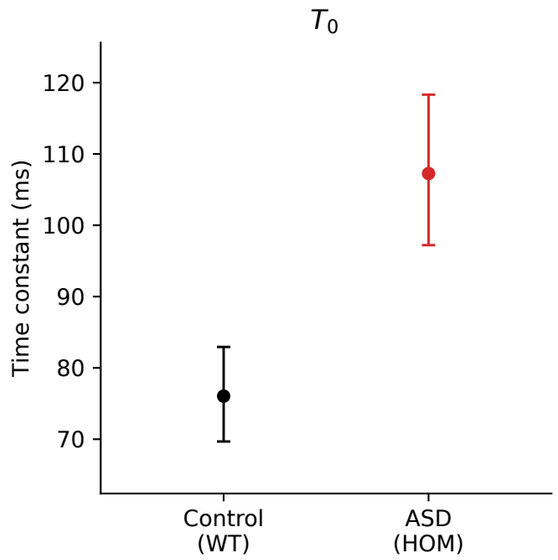
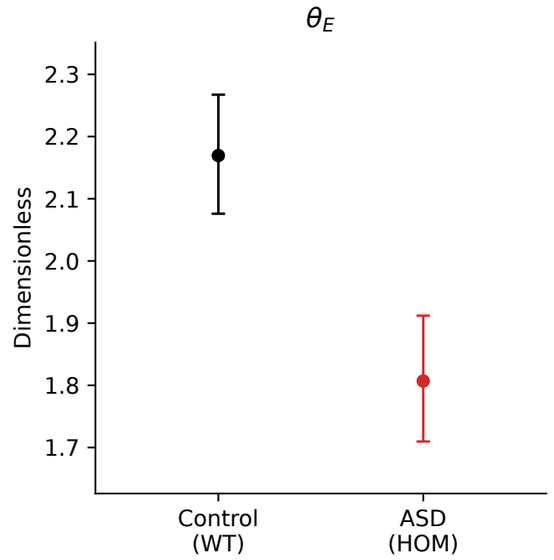
SHANK3 cohort 1 | NPL+alpha parameter comparison

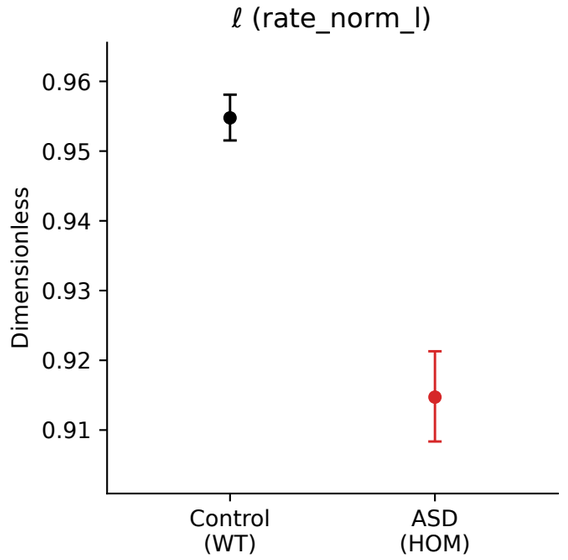
Control (WT) ASD (HOM)

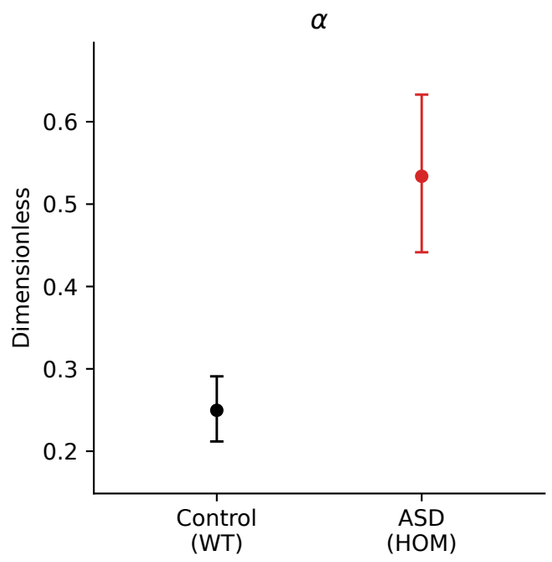
Posterior means and central 95% credible intervals | Control: 5 animals, 68,184 choices | ASD: 6 animals, 67,715 choices

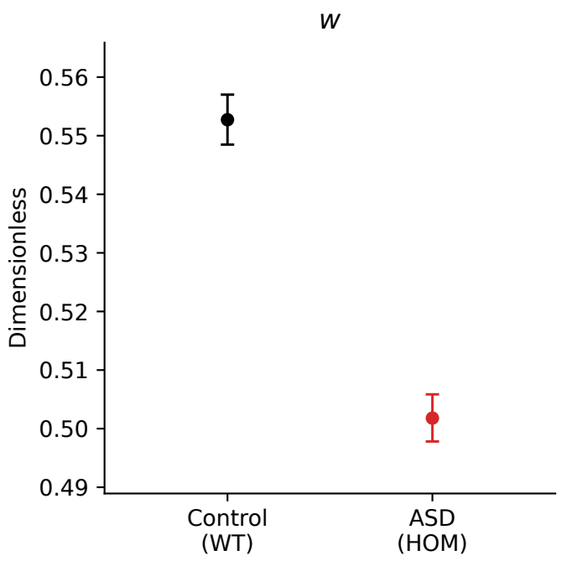


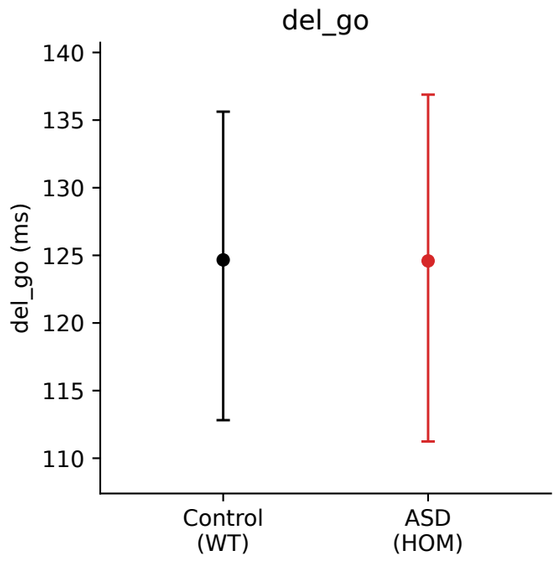


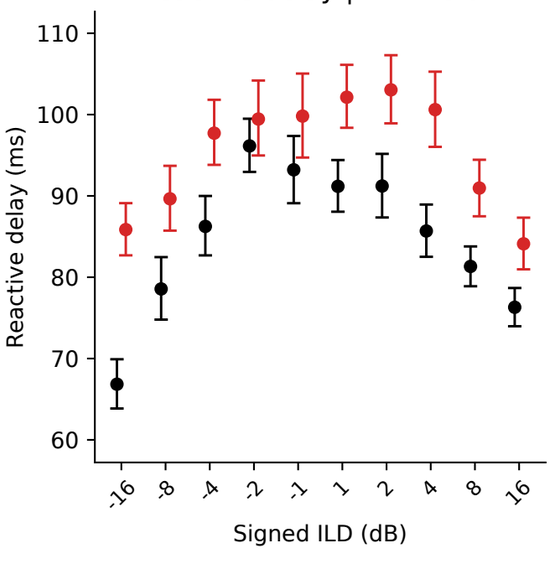


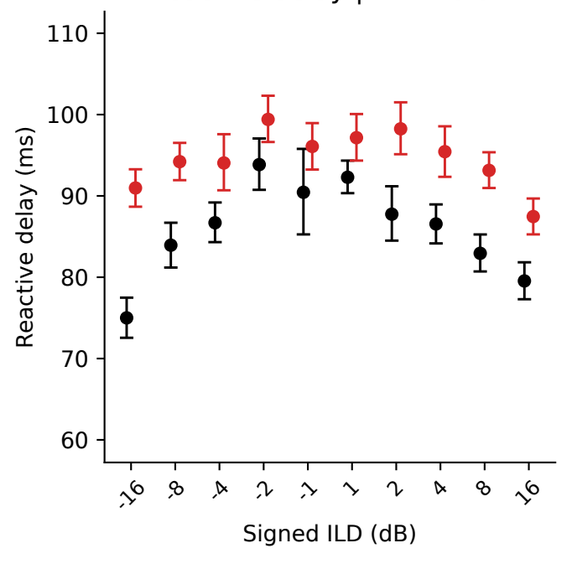


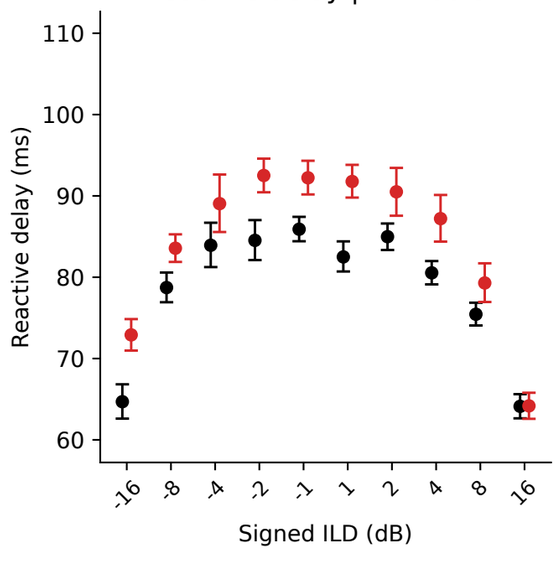












37 fitted parameters per genotype: seven shared parameters and 30 independent signed ABL–ILD delays. All time parameters are shown in ms.

Intervals describe conditional variational posterior uncertainty with proactive/exponential-lapse parameters fixed; they are not animal SEMs.

Saved 10,000-draw posteriors; no refitting, condition averaging or sign pooling.
